

Sure Grip Beam Clamp

The SureGrip beam clamp was developed so that it could be deployed from above the roof without the need to go inside the building.

Opening of the clamp is accomplished through its unique pivoting action. And its scissor clamping linkage provides a locking action that will not allow the clamp jaws to slip away from the beam once it is clamped in place.

The CSS beam clamp that connects directly to major roof beams is able to withstand much higher loads than possible with conventional beam clamps. No bolt holes are required in beam - preserving its structural integrity. Its wrap-around feature integrates the clamp structure with the beam to react to loads as one structure.

In summary SureGrip offers the following advantages:

- Ideal for steel beam supported roofs
- 4000 pound load capacity
- Installs in minutes
- No need to go inside building
- Fail Safe Cam Lock holds jaws tight
